The invention relates to a voltage-gated, pH sensitive potassium channel CC Slo3, expressed in spermatocytes. Slo3 has, as a monomer, calculated CC molecular weight 120-156 kD; has unit conductance (as a functional CC tetramer, when expressed in Xenopus oocytes) of 80-120 pS; has increased CC activity at intracellular pH above about 7.1 and binds specifically to polyclonal antibodies against sequences shown in ANY13437, ANY13438, CC ANY13442, and ANX13443. Slo3 is involved in sperm capacitation advor the CC acrosome reaction, essential steps in fertilization. Slo3, and the CC acrosome reaction, essential steps in fertilization. Slo3, and the CC contraceptives), also for studying sperm physiology in vitro. CC slo3-specific antibodies are used to identify specific inhibitors and CC contraceptives), also for studying sperm physiology in vitro. CC slo3-specific antibodies are used for diagnostic detection of Slo3 CC expression. Slo3, as part of a chimera with another channel protein, can be used as a reporter for measuring changes in potassium concentration, CC current flow, ion flux, etc. Fragments of Slo3 nucleic acid are useful as CC probes for identifying homologs, variants and mutants associated with CC disease; to detect Slo3- related mRNA or protein; for chromosomal CC constation; in gene therapy; for identifying potential modulators; to measure up-regulation of Slo3 in drug screening assays and for production of recombinant Slo3 protein. The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

CC The invention relates to a voltage-gated, pH sensitive potassium channel CC Slo3, expressed in spermatocytes. Slo3 has, as a monomer, calculated CC molecular weight 120-156 kD; has unit conductance (as a functional CC tetramer, when expressed in xenopus cocytes) of 80-120 pS; has increased CC activity at intracellular pH above about 7.1 and binds specifically to polyclonal antibodies against sequences shown in AXI3437, AAXI3438, CC AAXI3442, and AAXI3443. Slo3 is involved in sperm capacitation and/or the CC acrosome reaction, essential steps in fertilization. Slo3, and the CC acrosome reaction, essential steps in fertilization. Slo3, and the CC contraceptives), also for studying sperm physiology in vitro. CC slo3-specific antibodies are used for diagnostic detection of Slo3 CC expression. Slo3, as part of a chimera with another channel protein, can be used as a reporter for measuring changes in potassium concentration, CC current flow, ion flux, etc. Fragments of Slo3 nucleic acid are useful as CC probes for identifying homologs, variants and mutants associated with CC disease; to detect Slo3- related mRNA or protein; for chromosomal CC contraction of Slo3 in Group screening assays and for production of recombinant Slo3 protein. The present sequence represents the nucleotide sequence of hSlo3-2.

potassium channel r, calculated

monomer,

```
CC molecular weight 120-156 kD; has unit conductance (as a functional CC tetramer, when expressed in Xenopus cocytes) of 80-120 pS; has increased. CC activity at intracellular pH above about 7.1 and binds specifically to CC polyclonal antibodies against sequences shown in AX13437, AXY3438, CC AXY3442, and AXY3443. Slo3 is involved in sperm capacitation and/or the CC acrosome reaction, essential steps in fertilization. Slo3, and the nucleic acid encoding it, are used to identify specific inhibitors and CC contraceptives), also for studying sperm physiology in vitro. CC Slo3-specific annibodies are used for diagnostic detection of Slo3 CC expression. Slo3, as part of a chimera with another channel protein, can be used as a reporter for measuring changes in potassium concentration, CC current flow, ion flux, etc. Fragments of Slo3 nucleic acid are useful as CC probes for identifying homologs, variants and mutants associated with CC disease; to detect Slo3- related mRNA or protein; for chromosomal CC localization; in gene therapy; for identifying potential modulators; to G measure up-regulation of Slo3 in drug screening assays and for production of recombinant Slo3 protein. The present sequence represents a DNA CC encoding a mouse Slo3 (mSlo3).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
CC S13, expressed in Spermatocytes. S103 has, as a monomer, calculated complexular weight 120-156 kD; has unit conductance (as a functional ctetramer, when expressed in Xenopus cocytes) of 80-120 pS; has increased cc activity at intracellular pH above about 7.1 and binds specifically to plyclonal antibodies against sequences shown in AAY13437, AAY13438, carrosome reaction, essential steps in fertilization. S103, and the cc acrosome reaction, essential steps in fertilization. S103, and the cc nucleic acid encoding it, are used to identify specific inhibitors and activators (potentially useful for treating infertility and as contraceptives), also for studying sperm physiology in vitro. CC expression. S103, as part of a chimera with another channel protein, can be used as a reporter for measuring changes in potassium concentration, current flow, ion flux, etc. Fragments of Slo3 nucleic acid are useful as current flow, ion flux, etc. Fragments and mutants associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ното

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                    Nucleic acids hybridization a single surfa
                        The present invention relates to a composition comprising two nuclear each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatc) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                             acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids containing electron-transfer group, useful as labels hybridization assays, e.g. for genotyping, allowing repeat analyses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide D2007
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO200107665-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nuclei acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids containing electron transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses or

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nuclei acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                      Nucleic acids containing electron-transfer group, useful as labels hybridization assays, e.g. for genotyping, allowing repeat analyses a single surface .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1043

```
Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses or a single surface -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-JUL-1999;
